

Title: Contact Book Web App

By Goddy Rosanna

HTML | CSS | JavaScript |

LocalStorage

August 2026

APP FEATURES

- Add Contacts: Save name, phone, and email
- Search Contacts: Find contacts instantly by typing name
- Delete Contacts: Remove contacts with one click
- Data Persistence: Saves contacts using browser LocalStorage
- Responsive: Works on both phone and desktop

DESIGN DECISIONS MADE

Header: Used LocalStorage instead of a Database

Why:

1. No Backend Needed → Runs 100% in the browser
2. Data Persists → Contacts don't disappear after refresh
3. Easy Deployment → Can host directly on GitHub Pages
4. Beginner Friendly → Simple to learn and implement

BUG FIXED ALONG THE WAY

Bug: Contacts were disappearing after refreshing the page

Cause: Contacts were only stored in a JS array, not saved anywhere

Solution:

Created `saveToLocalStorage()` and `loadFromLocalStorage()` functions

Now data loads automatically when the app starts

Result: Contacts now stay saved permanently.

CONCLUSION

This project helped me learn:

- HTML, CSS, and JavaScript basics
- How to plan and build a web application
- How to debug and solve real problems
